Nella reported completing Tuulas' 53 tasks, but encountered a problem of hardcoded 100 images, which caused the system to crash. She is currently working on fixing this issue and trying to get Tuula's image-sending function to work properly.

Arttu, who is busy at work, has yet to start working on his tasks for this week.

Borna is working on identifying the RPI device on the device page, adding RF tests, and planning to run Arttu's model on the RPI. He also made some modifications to the codecov yaml file.

Tuula, like Nella, encountered the same problem with the hardcoded images but is now trying to fix it and make the image-sending function work correctly.

Matias is also working on identifying the RPI device, adding RF tests, and planning to run Arttu's model on the RPI. He also made some modifications to the codecov yaml file.

Finally, **Leevi** is currently working on getting Arttu's model to work on the Arduino. He encountered an issue with an invocation error but is now focusing on the Weabb prediction task.
